

Winning Space Race with Data Science

Utkarsh Varshney 18th December, 2023

Outline

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

Executive Summary

- Data was collected from the public SpaceX API and SpaceX Wikipedia page. A
 column 'class' was created to classify successful landings. Exploratory analysis
 was conducted using SQL, visualisation, folium maps, and dashboards. Relevant
 columns were gathered to be used as features. All categorical variables were
 changed to binary using one-hot encoding. The data was standardised, and
 GridSearchCV was utilised to find the best parameters for machine learning
 models. The accuracy of all models was visualised.
- Four machine learning models were chosen: Logistic Regression, Support Vector Machine, Decision Tree Classifier, and K Nearest Neighbours. All produced similar results with accuracy rate of about 83.33%. All models over predicted successful landings i.e. False Positives. More data is needed for better model determination and accuracy.

Introduction

Background:

- SpaceX launches rockets quite economically, their cost being \$62 million vs. \$165 million charged by other providers.
- They are able to cut costs by recovering the Stage 1 part of the Falcon-9 rocket, and reusing it.

Problem:

- SpaceY wants to compete with SpaceX.
- They have tasked us to train an ML model to predict a successful Stage 1 recovery of the Falcon-9.
- This prediction will help estimate the cost of a launch and can help SpaceY in bidding against SpaceX.

Methodology

Executive Summary

- Data collection methodology:
 - Data was web-scraped from the SpaceX public API and the SpaceX Wikipedia page.
- Perform data wrangling
 - Launches were categorised based on landing status (successful/unsuccessful).
- Perform exploratory data analysis (EDA) using visualisation and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - Data was standardised, then split into training and testing sets.
 - GridSearchCV was used for tuning the hyper-parameters.
 - Accuracy scores were obtained and confusion matrices were plotted for each model.

Data Collection

- The collection of data was a combination of:
 - Requests from SpaceX public API
 - Web-Scraping data from SpaceX Wikipedia entry.

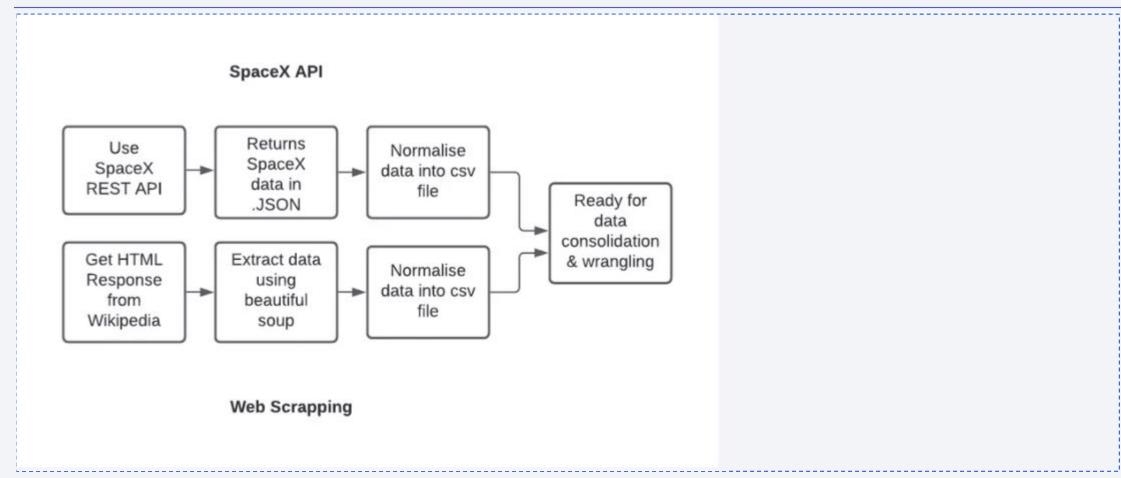

Space X API Data Columns:

FlightNumber, Date, BoosterVersion, PayloadMass, Orbit, LaunchSite, Outcome, Flights, GridFins, Reused, Legs, LandingPad, Block, ReusedCount, Serial, Longitude, Latitude

Wikipedia Webscrape Data Columns:

Flight No., Launch site, Payload, PayloadMass, Orbit, Customer, Launch outcome, Version Booster, Booster landing, Date, Time

Data Collection – SpaceX API and Scraping from Wiki

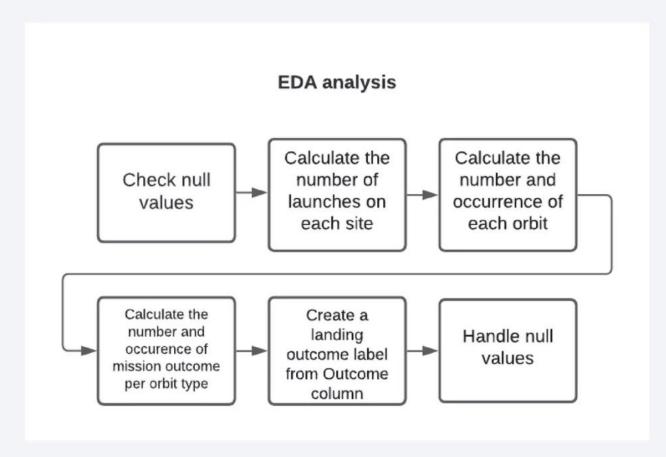

- Data Collection via SpaceX API
- Webscraping from Wikipedia

Data Collection - Scraping

Place your flowchart of web scraping here

• https://github.com/utkarshv1/Applied-Data-Science-Capstone/blob/main/jupyter-labs-webscraping.ipynb

Data Wrangling

• Link to Code

EDA with Data Visualization

Following charts were plotted under data visualisation:

- Flight number vs Payload Mass (indicating variation of mass against successive launches) and subsequent landing outcomes).
- Flight number vs Launch Sites (success rates of subsequent attempts at different sites).
- Launch Sites vs Payload Mass (whether preference for lighter/heavier payloads has skewed the relative success rates of different launch sites).
 - Success Rates vs Orbit Type
 - Flight Number vs Orbit Type
- Payload vs Orbit type
 Above 3 to ascertain if certain orbits show better success rates for certain payloads and if that success rate has varied over subsequent attempts
- Success Rate vs Year (visualising progress).

Link to code

EDA with SQL

Following SQL queries were executed for EDA:

- Display the names of the unique launch sites in the space mission
- Display 5 records where launch sites begin with the string 'CCA'
- Display the total payload mass carried by boosters launched by NASA (CRS)
- Display average payload mass carried by booster version F9 v1.1
- List the date when the first successful landing outcome in ground pad was achieved.
- List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000
- List the total number of successful and failure mission outcomes
- List the names of the booster_versions which have carried the maximum payload mass. Use a subquery
- List the records which will display the month names, failure landing_outcomes in drone ship ,booster versions, launch_site for the months in year 2015.
- Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order.
- Link to code

Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
 - Are launch sites near railways, highways and coastlines.
 - Do launch sites keep certain distance away from cities.
- Link to code

Build a Dashboard with Plotly Dash

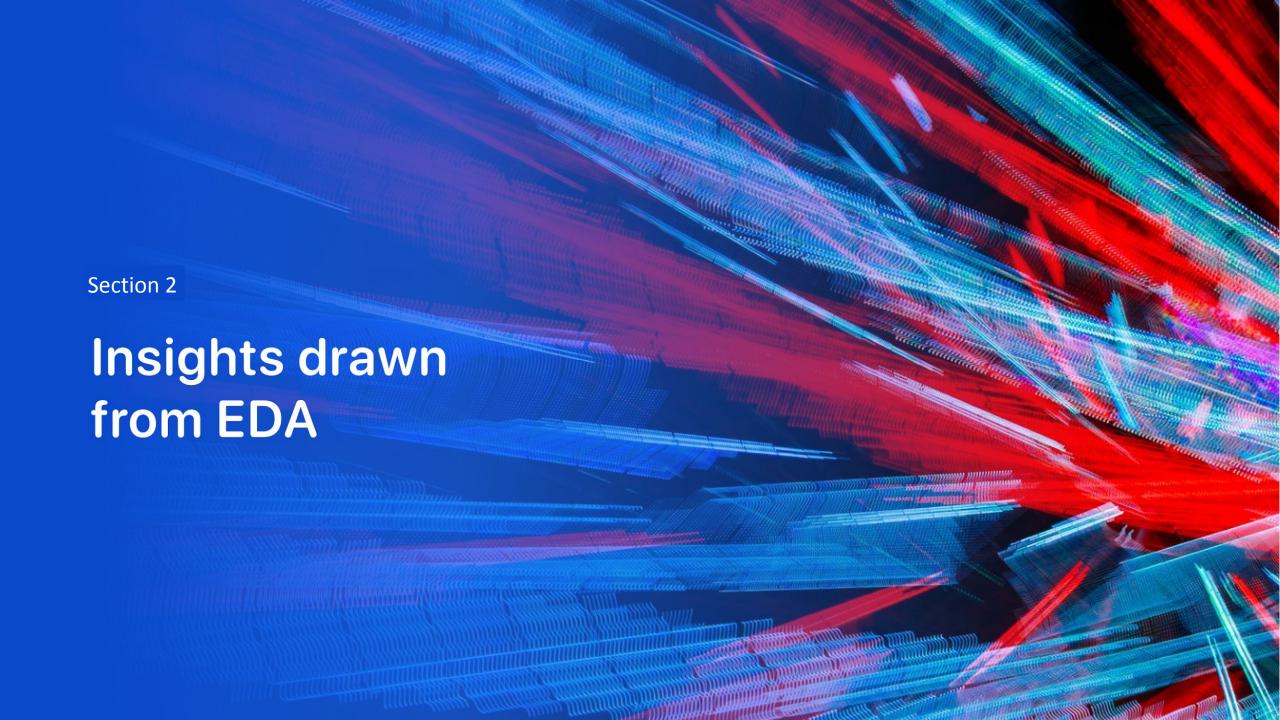

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.
- Link to code

Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.
- Link to code

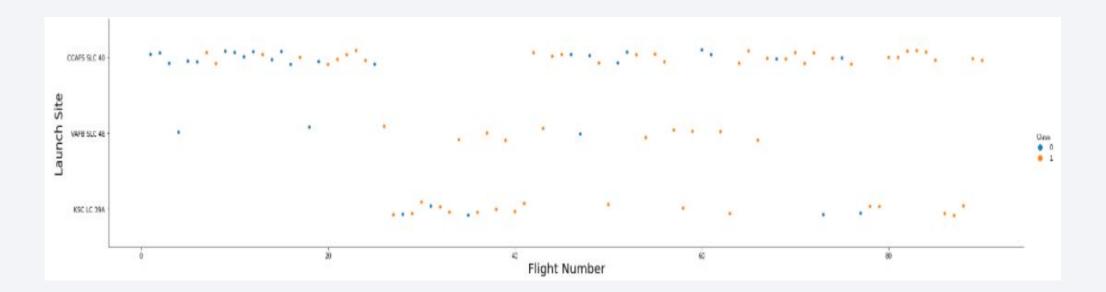

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

Flight Number vs. Launch Site

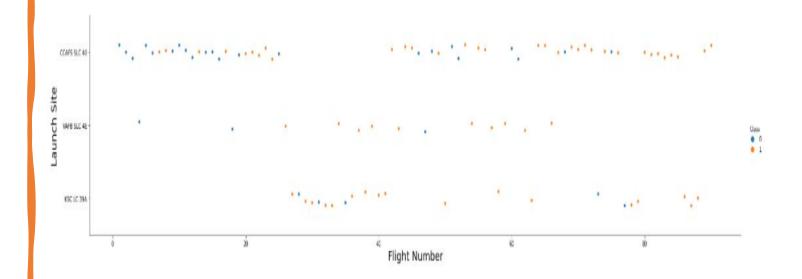

• From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

Payload vs. Launch Site

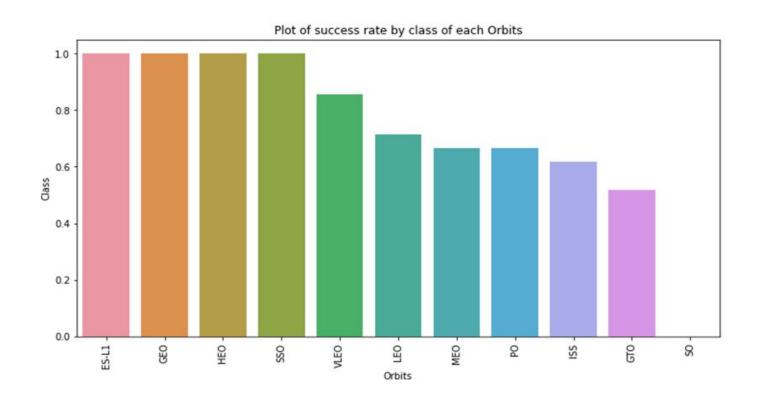

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

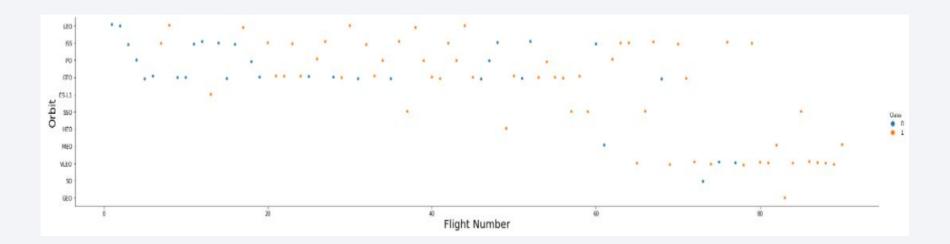

Success Rate vs. Orbit Type

 From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

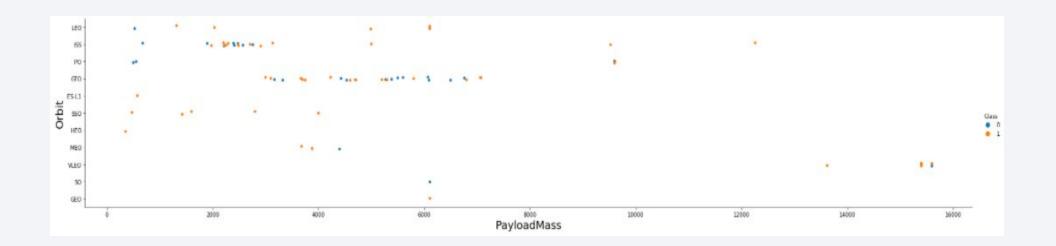

Flight Number vs. Orbit Type

• The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

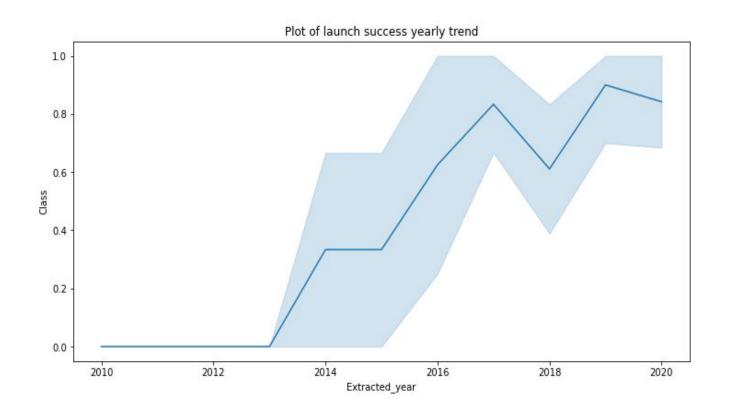

Payload vs. Orbit Type

 We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

Launch Success Yearly Trend

• From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

All Launch Site Names

We used the key word
 DISTINCT to show only
 unique launch sites from the
 SpaceX data.

Display the names of the unique launch sites in the space mission

Out[10]:	launchsite		
	0	KSC LC-39A	
	1	CCAFS LC-40	
	2	CCAFS SLC-40	
	3	VAFB SLC-4E	

Launch Site Names Begin with 'CCA'

 We used the query above to display 5 records where launch sites begin with `CCA`

Total Payload Mass

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)

In [12]: 

task_3 = '''

SELECT SUM(PayloadMassKG) AS Total_PayloadMass
FROM SpaceX
WHERE Customer LIKE 'NASA (CRS)'

""

create_pandas_df(task_3, database=conn)

Out[12]: 

total_payloadmass

0     45596
```

Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

Display average payload mass carried by booster version F9 v1.1

First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22nd December 2015

Successful Drone Ship Landing with Payload between 4000 and 6000

Out[15]: boosterversion

0 F9 FT B1022

1 F9 FT B1026

2 F9 FT B1021.2

3 F9 FT B1031.2

 We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

```
In [16]:
          task 7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task 7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create pandas df(task 7a, database=conn))
          print()
          print('The total number of failed mission outcome is:')
          create pandas df(task 7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
                      100
         The total number of failed mission outcome is:
Out[16]:
            failureoutcome
```

 We used wildcard like '%' to filter for WHERE MissionOutcome was a success or a failure.

Boosters Carried Maximum Payloa d

 We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function. List the names of the booster_versions which have carried the maximum payload mass. Use a subquery

Out[17]:		boosterversion	payloadmasskg
	0	F9 B5 B1048.4	15600
	1	F9 B5 B1048.5	15600
	2	F9 B5 B1049.4	15600
	3	F9 B5 B1049.5	15600
	4	F9 B5 B1049.7	15600
	5	F9 B5 B1051.3	15600
	6	F9 B5 B1051.4	15600
	7	F9 B5 B1051.6	15600
	8	F9 B5 B1056.4	15600
	9	F9 B5 B1058.3	15600
	10	F9 B5 B1060.2	15600
	11	F9 B5 B1060.3	15600

2015 Launch Records

 We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

```
In [19]:
    task_10 = '''
        SELECT LandingOutcome, COUNT(LandingOutcome)
        FROM SpaceX
        WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
        GROUP BY LandingOutcome
        ORDER BY COUNT(LandingOutcome) DESC
        '''
    create_pandas_df(task_10, database=conn)
```

Out[19]:		landingoutcome	count
	0	No attempt	10
	1	Success (drone ship)	6
	2	Failure (drone ship)	5
	3	Success (ground pad)	5
	4	Controlled (ocean)	3
	5	Uncontrolled (ocean)	2
	6	Precluded (drone ship)	1
	7	Failure (parachute)	1

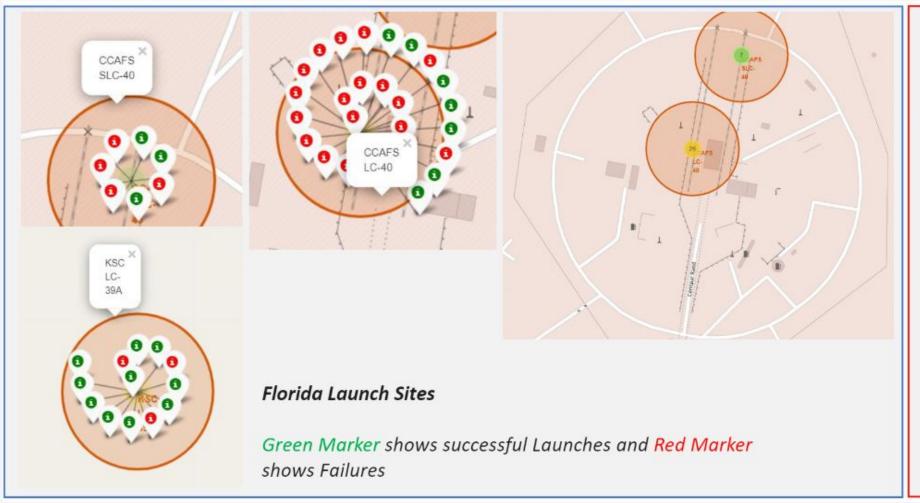

- We selected Landing outcomes and the COUNT of landing outcomes from the data and used the WHERE clause to filter for landing outcomes BETWEEN 2010-06-04 to 2010-03-20.
- We applied the GROUP BY clause to group the landing outcomes and the ORDER BY clause to order the grouped landing outcome in descending order.

All launch sites global map markers

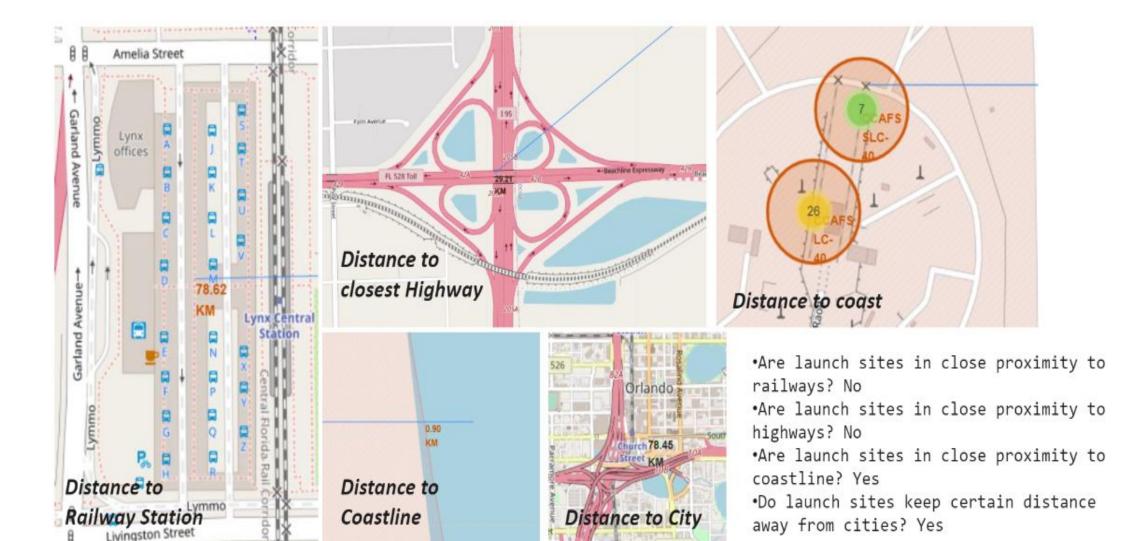

Markers showing launch sites with color labels

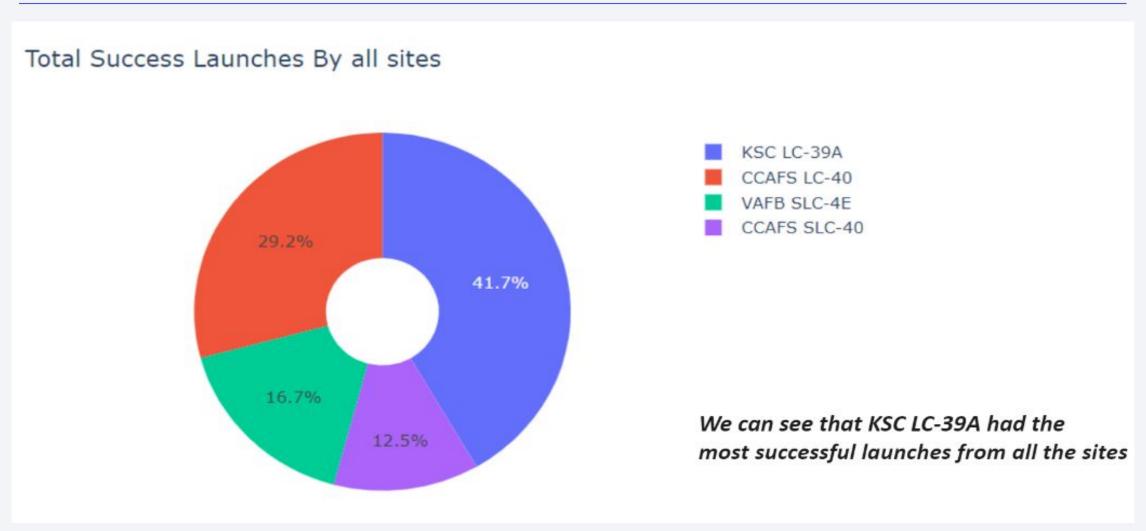

Launch Site distance to landmarks

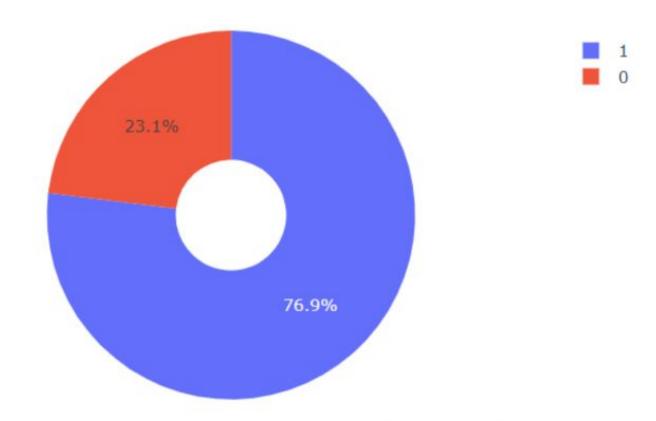

Pie chart showing the success percentage achieved by each launch site

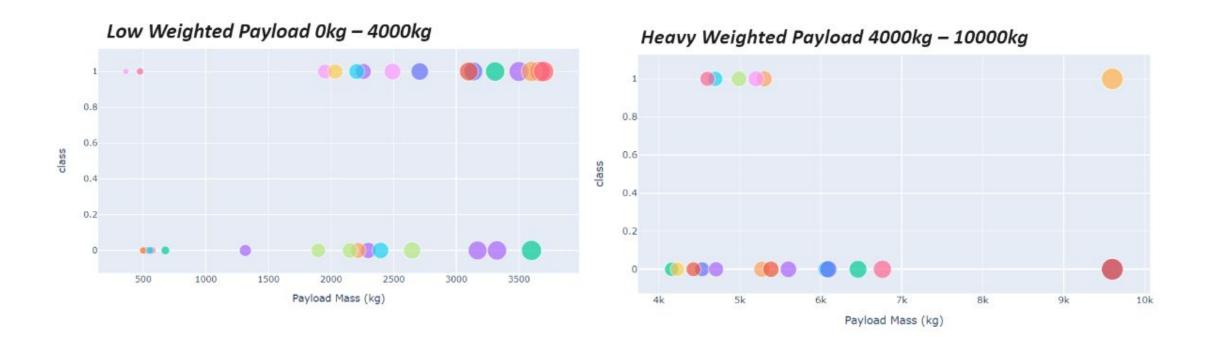

Pie chart showing the Launch site with the highest launch success ratio

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

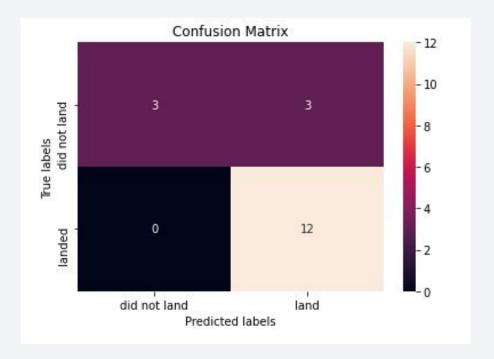

Classification Accuracy

 The decision tree classifier is the model with the highest classification accuracy

```
In [32]:
          models = {'KNeighbors':knn_cv.best_score_,
                        'DecisionTree':tree_cv.best_score_,
                        'LogisticRegression':logreg cv.best score ,
                        'SupportVector': svm_cv.best_score_}
          bestalgorithm = max(models, key=models.get)
          print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
          if bestalgorithm == 'DecisionTree':
              print('Best params is :', tree cv.best params )
          if bestalgorithm == 'KNeighbors':
              print('Best params is :', knn cv.best params )
          if bestalgorithm == 'LogisticRegression':
              print('Best params is :', logreg cv.best params )
          if bestalgorithm == 'SupportVector':
              print('Best params is :', svm cv.best params )
        Best model is DecisionTree with a score of 0.9017857142857144
        Best params is : {'criterion': 'gini', 'max depth': 18, 'max features': 'sqrt', 'min samples leaf': 2, 'min sample
        s split': 2, 'splitter': 'best'}
```

Confusion Matrix

 The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.
